## Mathelpers

## Arithmetic Operations with Integers

## Part A: Adding Integers

One way to add integers is to use a number line.

To add a positive integer, move to the right.

Example 1: Use a number line to find the sum.
a) $3+(-9)$

Start at the number 3, we want to add a negative integer so we move to the left 9 units, we will reach -6.

The final position is ${ }^{-} 6$. So, $3+(-9)={ }^{-} 6$.
b) $-5+3$

Start at the integer -5 , we are adding a positive integer so we move to the right 3 units, we reach the integer -2

The final position is ${ }^{-} 2$. So, ${ }^{-} 5+3={ }^{-} 2$.

Absolute Values: You can use absolute values to find the sum of two or more integers.

| Words | Numbers |
| :---: | :---: |
| Adding numbers with the same sign If two numbers have the same sign, add their absolute value and use the sign of the numbers | $\begin{gathered} 8+12=20 \\ -6+(-4)=-10 \end{gathered}$ |
| Adding numbers with different signs If two numbers have different signs, find the difference of their absolute values and use the sign of the number with the greater absolute value | $5+\left(^{-} 8\right)=-3$ <br> Step1: ${ }^{-8}$ in absolute value is greater than 5 $-11+13=2$ |
| Opposites <br> The sum of a number and its opposite is zero | $\left.7+{ }^{-} 7\right)=0$ |

## Part B: Subtracting Integers

As you can see from the number lines below, the expression 5-4 and 5+(4) have the same value, 1.

These equivalent expressions suggest the following rule for subtracting integers.

| Subtracting Integers | Numbers | Algebra |
| :--- | :--- | :--- |
| To subtract a number, add its <br> opposite. Then follow the rules for <br> adding signed numbers | $=3-7$ |  |

## Part C: Multiplying and Dividing Integers

Use patterns to multiply integers.
2

| Expression | Product |
| :--- | :--- |
| $3(3)$ | 9 |
| $3(2)$ | 6 |
| $3(1)$ | 3 |
| $3(0)$ | $?$ |
| $3(-1)$ | $?$ |
| $3(-2)$ | $?$ |

| Expression | Product |
| :--- | :--- |
| $2(-3)$ | $?$ |
| $1\left(^{-} 3\right)$ | $?$ |
| $0\left(^{-} 3\right)$ | $?$ |
| $-1\left(^{-} 3\right)$ | $?$ |
| $-2(-3)$ | $?$ |
| $-3(-3)$ | $?$ |

You may have recognized patterns in the products of integers. These patterns suggest the following rules.

| Words | Numbers |
| :--- | :--- |
| The product of two integers with the same <br> sign is positive. | $-2(-4)=8$ <br> $2(4)=8$ |
| The product of two integers with different <br> signs is negative. | $-2(4)=-8$ |
| The product of any integer and 0 is 0. | $2(0)=-8$ |
|  | $-2(0)=0$ |

Dividing Integers Because $3(-4)=-12$, you know that $-12 \div 3=-4$ and $-12 \div(-4)=3$. This relationship between products and quotients suggests that the rules for dividing integers are like the rules for multiplying integers.

| Words | Numbers |
| :--- | :--- |
| The quotient of two integers with the <br> same sign is positive. | $8 \div 4=2$ |
| The quotient of two integers with <br> different signs is negative. | $-8 \div 4=2=^{-} 2$ |
| The quotient of 0 and any nonzero <br> integer is 0. | $0 \div 4)=^{-2}$ |
