## Solving Multi-Step Inequalities

An inequality is a statement in which two expressions are not equal.
The following chart shows several inequality symbols and their meaning.

| Statements of Inequality |  |
| :--- | :--- |
| $a$ is less than $b$. | $a<b$ |
| $a$ is greater than $b$. | $a>b$ |
| a is less than or equal to $b$ ( or $a$ is at most $b$ ). | $a \leq b$ |
| $a$ is greater than or equal to $b$ ( or $a$ is at least $b$ ). | $a \geq b$ |
| $a$ is greater than $b$ and less than $c$. | $b<a<c$ |
| $a$ is greater than or equal to $b$ and less than or equal to $c$. | $b \leq a \leq c$ |
| $a$ is not equal to $b$. | $a \neq b$ |

You know that 3 is less than 8 . This can be shown in two ways.

$$
\begin{aligned}
& 3<8 \text { means } 3 \text { is less than } 8 \\
& 8>3 \text { means } 8 \text { is greater than } 3
\end{aligned}
$$

Think about $3<8$. This sentence is true. Is $3>8$ true? Is $3=8$ true? Note that only one of the three sentences is true. This can be summarized by the following property.

## Comparison Property

For any two numbers $a$ and $b$, exactly one of the following sentences is true.

$$
a<b \quad a=b \quad a>b
$$

## Example 1:

a) Is $4<5 \frac{\mathbf{1}}{\mathbf{2}}$ true or false?

$$
4<5 \frac{1}{2} \text { means } 4 \text { is less than } 5 \frac{1}{2} \text {. This sentence is true. }
$$

b) Is $9>4+3+2+1$ true or false?

$$
\begin{aligned}
& 9^{?}>4+3+2+1 \\
& 9^{?}>10
\end{aligned}
$$

Since 9 is not greater than 10 , the sentence is false.

Recall that there are three properties of equality. Equality is reflexive, symmetric, and transitive. Do inequalities have these same properties?

| Reflexive: | $6>6$ | False |
| :--- | :--- | :--- |
| Symmetric: | If $4>3$, then $3>4$ | False |
| Transitive: | If $6>3$ and $3>1$, then $6>1$ | TRUE |

The relation > is not reflexive or symmetric. However, it is transitive. Explore some similar examples to verify that < is transitive.

## Comparison Property of Order

For all numbers $\mathrm{a}, \mathrm{b}$ and c ,

1) If $a<b$ and $b<c$, then $a<c$.
2) If $a>b$ and $b>c$, then $a>c$.

## Addition and Subtraction Properties of Inequalities

For all numbers $\mathrm{a}, \mathrm{b}$ and c
If $\mathrm{a}<\mathrm{b}$, then $\mathrm{a}+\mathrm{c}<\mathrm{b}+\mathrm{c}$.
If $\mathrm{a}>\mathrm{b}$, then $\mathrm{a}+\mathrm{c}>\mathrm{b}+\mathrm{c}$.
If $\mathrm{a}<\mathrm{b}$, then $\mathrm{a}-\mathrm{c}<\mathrm{b}-\mathrm{c}$.
If $\mathrm{a}>\mathrm{b}$, then $\mathrm{a}-\mathrm{c}>\mathrm{b}-\mathrm{c}$.

Example 3: Solve, Graph and check: $m+7>12$

$$
m+7 \quad 2-7 \quad \text { Subtract } 7 \text { from both sides. }
$$

$m \geq 5$
The solution set is \{all numbers greater than 5$\}$

Check:
Substitute one or two numbers greater than 5 , such as 6 and 10 into the inequality. For numbers greater than 5 , the inequality should be true.
$m+7 \geq 12$
$m+7 \stackrel{?}{\geq} 12$
$6+7 \geq 12$ Try 6
$10+7 \geq 12$ Try 10
$13 \geq 12 \checkmark$
$17 \geq 12 \checkmark$

What happens if both sides of an inequality are multiplied by the same negative number?

$$
\begin{gathered}
-4<6 \\
-4(-3) ? 6(-3) \\
12 \stackrel{?}{<}-18 \text { False }
\end{gathered}
$$

$$
\begin{aligned}
& -4<6 \\
& -4\left(-\frac{1}{2}\right) \stackrel{?}{<} 6\left(-\frac{1}{2}\right) \\
& 2 \stackrel{?}{<}-3 \text { False }
\end{aligned}
$$

The inequality $12<-18$ is false, but $12>-18$ is true. Also, $2<-3$ is false, but $2>-3$ is true. Thus, when both sides of an inequality are multiplied by the same negative number, the direction of the inequality must be reversed.

## Multiplication Property of Inequality

For all numbers $\mathrm{a}, \mathrm{b}$ and c
For c>0:

$$
\begin{aligned}
& \text { If } \mathrm{a}<\mathrm{b} \text {, then } \mathrm{ac}<\mathrm{bc} \text {. } \\
& \text { If } \mathrm{a} \text { b, then } \mathrm{ac}>\mathrm{bc} \text {. }
\end{aligned}
$$

For $\mathrm{c}<0$ :

$$
\begin{aligned}
& \text { If } \mathbf{a}<\mathbf{b} \text {, then } \mathrm{ac}>\mathrm{bc} \text {. } \\
& \text { If } \mathrm{a}>\mathrm{b} \text {, then } \mathrm{ac} \text { < } \mathbf{b c} \text {. }
\end{aligned}
$$

Recall that $\frac{a}{b}$ (or $a \div b$ ) is equivalent to $a\left(\frac{1}{b}\right.$ ) for all numbers when $b$ is not zero. The multiplication property for inequalities can also apply to division. When solving inequalities, you can multiply (or divide ) both sides by the same positive number. You can also multiply ( or divide ) both sides by the same negative number if you reverse the direction of the inequality.

## Division Property of Inequality

## For all numbers $\mathrm{a}, \mathrm{b}$ and c

For $\mathrm{c}>0$ :

$$
\begin{aligned}
& \text { If } \mathbf{a}<\boldsymbol{b} \text {, then } \frac{a}{c}<\frac{b}{c} . \\
& \text { If } \mathbf{a}>\boldsymbol{b} \text {, then } \frac{a}{c}>\frac{b}{c} .
\end{aligned}
$$

For $\mathrm{c}<0$ :

$$
\begin{aligned}
& \text { If } \mathbf{a}<\boldsymbol{b} \text {, then } \frac{a}{c}>\frac{b}{c} . \\
& \text { If } \mathbf{a}>\boldsymbol{b} \text {, then } \frac{a}{c}<\frac{b}{c} .
\end{aligned}
$$
